TINYSPOOLS by TinyOwl

Your filament, sorted.

For people who just want to know what filament they have, where it is and how much is left. Adding a spool takes seconds, and the palette shows every color you own at a glance.

Add in seconds

Scan the box barcode, touch a Bambu Lab spool or pick the color from the catalog.

Pick from the palette

Every color you own, with the grams left.

AMS keeps the count

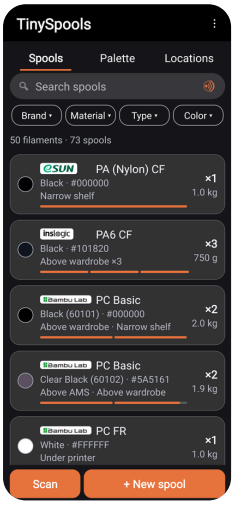

What is in your Bambu Lab AMS, with the grams left taken from the printer.

Independent app. Not made, endorsed or supported by any filament manufacturer.

WHAT YOU SEE

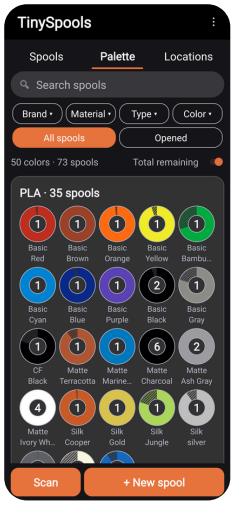

Three tabs: Spools, Palette, Locations.

A **filament** is a brand, material, type and color, for example Bambu Lab PETG HF Blue. A **spool** is one physical spool of it, with its own grams left and shelf. One filament can have many spools.

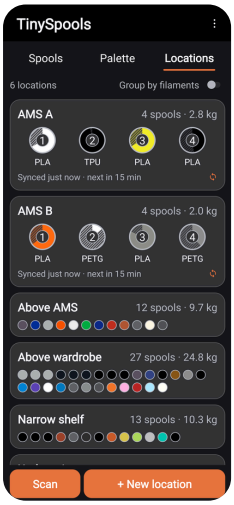

Spools

Every filament with its logo, color and code, how many spools you have (×2) and on which shelves; the bar shows each spool's grams left (up to 10, or the total in Settings). Search looks at everything at once; Brand, Material, Type and Color filters show how many spools match each choice, and **Show** tells how many will be left. Type also filters **Spool** or **Refill**.

Palette

Every color you own, grouped by material and drawn as spools (or squares, in Settings). The number is how many spools of that color. Turn on **Total remaining** above the palette and each color fills by how much is left on all its spools together: a pie on spools, a level on squares, the used part striped. Switch to **Opened** to see only the spools you have started, with what is left on them, so the next print can use up what is already open. It works together with **Material** and the other filters. Tap a color to see all its spools from every brand.

Locations

Your shelves, dryers or boxes, each with its number of spools, the grams left on it and a dot for every filament on it. Turn off **Group by filaments** for a dot, and inside a location a row, for every spool. Tap one to see only its spools; long-press to rename it, delete it or set it as a Bambu AMS (page 4). Tap a spool there to edit it, long-press it for the whole filament. **+ New location** adds one.

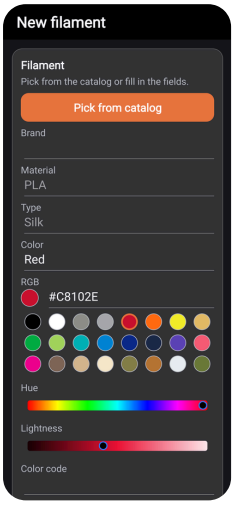

A spool

Tap a spool card. The big number is the grams left: tap it to type, or use the slider and -50 / -10 / +10 / +50 / **Empty**. Turn on **Subtract used** to type what a print used instead: the grams left are worked out, and the switch is remembered. Mark it **Spool** or **Refill**, tap a shelf to move it there, and make its QR label or NFC sticker. When adding, **- 1 spool +** adds several at once. **Delete** asks first, because the spool's labels stop working.

The theme (System, Dark, Light), the palette style and block order, the Spools list order, the filter layout (one row or two rows) and how many rows of color dots a location shows (1 to 4) are in the menu → **Settings**. Menu → **Take a tour** shows the main features again. When Google Play has a newer version, the app asks to update; it can also be done in Settings → **App updates**.

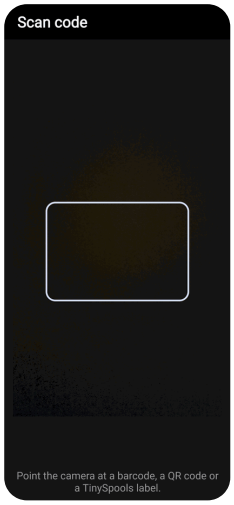

ADDING FILAMENT

Pick it, scan it or type it.

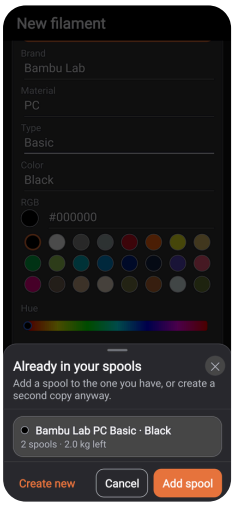

New filament

+ New spool first offers the filaments you already have. For a new one, tap **+ New filament**, then **Pick from catalog** or fill in the fields: no RGB code? Tap a color and fine-tune it with **Hue** and **Lightness**. Save, and the first spool opens right away.

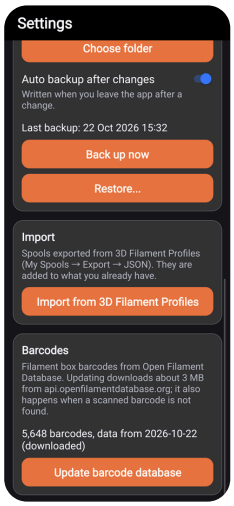

Scan a box

Scan reads the barcode on a filament box. A known barcode finds the filament at once; a new one asks which filament it is, and the app remembers it. Touch a Bambu Lab spool to the phone, even with the app closed: a filament you have opens, a new one is offered with **Add**. If your phone case holds an access card, turn this off in **Settings → NFC**. In **+ New spool** the tag fills in the filament. If you entered that filament by hand, the app asks **Is it one of these?** once, showing your similar filaments with their shelves, and remembers your pick.

Already there?

If the same brand, material, type and color already exist, the app says so and offers **Add spool** to it instead of a second copy.

Barcode database

6,100+ barcodes from 44 brands come with the app. Settings → **Update barcode database** downloads the newest; the app also offers it when a scanned barcode is not found.

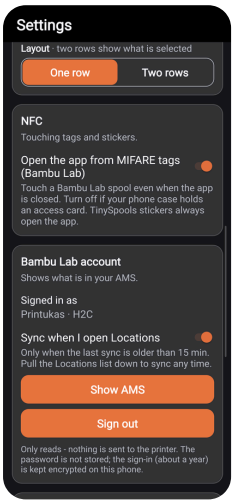

The catalog

The built-in catalog has 6,000+ colors from 86 brands (SpoolmanDB). Picking one fills in the brand, material, type, color, RGB value and full spool weight. Everything can be changed before you save, and filaments that are not in the catalog are simply typed in. Box barcodes come from the Open Filament Database.

BAMBU LAB AMS

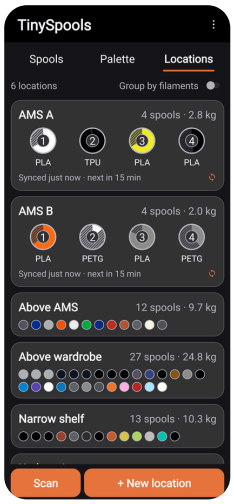

What is in the AMS, and how much is left.

Sign in with your Bambu Lab account and set a location as an AMS. TinySpools then shows each slot and keeps your spools in step with what the printer sees: the grams left on AMS spools follow your prints, with no weighing and no typing.

1. Sign in

Settings → **Bambu Lab account** → **Sign in**, with the same e-mail and password as in Bambu Handy. If Bambu Lab sends a code by e-mail, type it in. The password is not stored; the sign-in is kept encrypted on the phone for about a year.

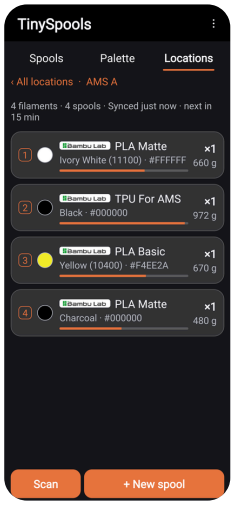

2. A location as an AMS

AMS locations are listed first. Long-press a location → **Bambu AMS** and pick the printer and the AMS unit (A, B, C or D). Its card now shows the AMS name and four slots: the color of each spool, its material and how much is left, the used part striped. An empty slot says **Empty**, a spool TinySpools does not know says **Unknown**. With several printers, each AMS is its own location.

3. Sync

TinySpools syncs by itself when you open Locations or an AMS location and the last sync is older than 15 minutes (Settings → **Sync when I open Locations**). To sync right now, pull the list down or tap ↻ under the AMS. The line under the AMS tells when it last synced and when the next sync is due. A **Sync with printers** button shows up below only when something needs you: not synced yet, or the last sync failed.

4. Tap a slot

Tap a slot to open its spool, or an **Unknown** slot to pick its spool. Long-press a spool for its whole filament. **? How locations work** at the bottom of Locations sums it all up.

What a sync changes

A spool found in the AMS moves to that AMS location. Its grams left follow the printer when it shows less than 100 % (an unmeasured spool shows 100 %). A card tells what changed, with **Undo**. A spool taken out of the AMS goes to **No location**.

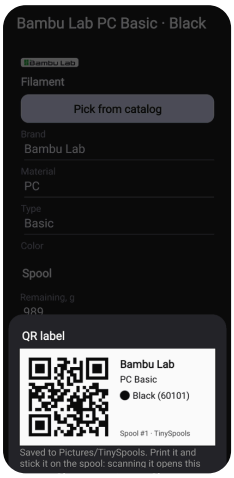

Which spool is which

A Bambu Lab spool is known by its tag: touch it to the phone once and it is linked. Another spool of the same filament is then linked by itself when it is the only unlinked one; colors are not guessed. A spool without a tag shows as **Unknown**: tap the slot and pick it. It stays there until it is taken out, a Bambu Lab spool goes in, or the slot is changed in Bambu Studio.

TinySpools only reads from Bambu Lab's cloud; it sends nothing to the printer. TinySpools is not affiliated with Bambu Lab.

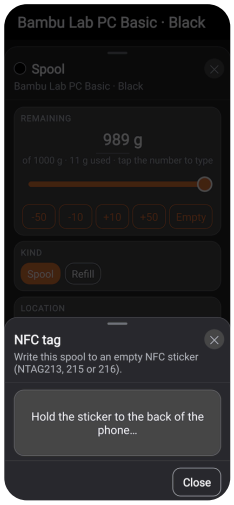

LABELS, CHECKS AND BACKUPS

A label on the spool, a check on the shelf.

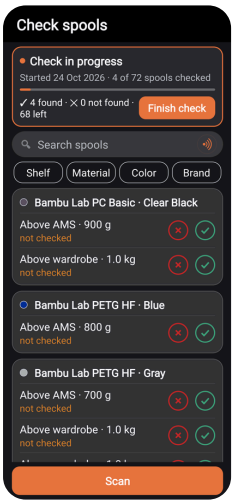

QR label

In a spool, **QR label** makes a label with the code, brand, material and color. It is saved to Pictures/TinySpools; **Share** sends it to your label printer's app. Scanning it with **Scan** opens that spool.

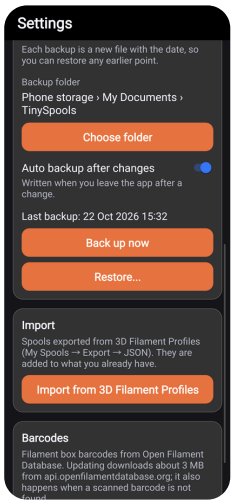

NFC sticker

NFC tag writes the spool to an empty NFC sticker (NTAG213, 215 or 216). Touching the sticker with the phone opens that spool, even when the app is closed. A sticker of another spool is simply written over; menu → **Erase NFC sticker** empties one. The phone vibrates and shows what it read. A spool opened from its QR label or NFC sticker is ready to move: tap a location and it moves there at once, with **Undo**. Closing it takes you back to where you were; tap the filament name under the title to see all its spools.

Check spools

Menu → **Check spools** → **Start check**. Mark each spool **Found** (✓) or **Not found** (×), shelf by shelf, or touch its sticker or Bambu Lab tag. **Finish check** can move the not found ones to **Unassigned**: when they turn up, tick them and tap **To the shelf**.

Backups

Settings → **Choose folder**, for example on Google Drive, then **Back up now**, or turn on **Auto backup** after changes. Each backup is a new file with the date; **Restore** brings back any of them.

A new phone

On the old phone make a backup to Google Drive. On the new one install TinySpools, choose the same folder and tap **Restore**: spools, shelves, your barcodes and settings come back.

Privacy

No TinySpools account, no ads, no analytics, no tracking, and no server of ours; nothing is sent to us. Everything stays on the phone, except the backup files you save to a folder of your choice. The app goes online only to update the barcode database when you ask, and, if you sign in to Bambu Lab, to read your AMS from Bambu Lab's cloud.
